

## STAR IMPROVEMENT PROGRAM

---

TARGETED OUTREACH FOR STARS

SinfoniaRx offers customized STAR Improvement Programs designed to improve both the Medicare Part D and Part C STAR measures. Our STAR Improvement Program Modules allow for precision accuracy in targeting individual STAR metrics at the CMS contract level. Through these modules, we are able to focus resources on improving and/or maintaining the STAR metrics most important to individual health plans.

## Part D STAR Improvement Programs

### Medication Adherence Modules

Diabetes Medications

Hypertension (RAS antagonists)

Cholesterol (Statins)

Medication adherence programs can be custom selected to target all three measures or focused to individual modules to target improvements to the area's most in need. Through our intensive medication surveillance, SinfoníaRx is able to proactively identify current and predicted future decreases in medication adherence. Our expert clinical staff will work with the patient and their provider to understand the individual needs of the patient and work with them to increase their adherence to the medication and reach the STAR improvement goals of the plan.

### Statin Use in Persons with Diabetes

Our detailed analysis identifies patients with diabetes, but not taking a statin to target the patient and their provider to work toward removing this gap in the patient's treatment therapy. Outcomes are geared toward achievement of the STAR improvement goals of each plan.

### So Much More...

With our full STAR Improvement program, plans can achieve targeted interventions for all Part D STAR and Display measures for their full Medicare population not already qualified for the CMS MTM program. The full targeting allows for plans to target improvement in their STAR ratings and to be proactive by focusing on display and future measures.

## Part C STAR Improvement for Medicare Advantage Programs

Our Medicare Advantage module is designed to address Medicare Part C measures, by incorporating our community pharmacy partners along with our dedicated clinical call centers to aid in performing targeted interventions for numerous Part C measures.
